

2020 MAT – Q6 (3 pages; 10/10/22)

Solution

(i) $g(1, k) = k$ [The single ball could be given to k people.]

(ii) $g(n, 1) = 1$ [The balls are all given to the single person.]

(iii) The $g(n, k)$ ways can be classified as follows:

(a) The 1st child receives at least one ball. Without loss of generality, it can be given the 1st ball. Number of ways in which the remaining $n - 1$ balls can be distributed to k children (including the 1st child) is $g(n - 1, k)$.

(b) The 1st child receives no balls. Number of ways in which the n balls can be distributed to the other $k - 1$ children is $g(n, k - 1)$.

So $g(n, k) = g(n - 1, k) + g(n, k - 1)$.

(iv) Hence $g(7, 5) = g(6, 5) + g(7, 4)$

$$= [g(5, 5) + g(6, 4)] + [g(6, 4) + g(7, 3)]$$

$$= [g(4, 5) + g(5, 4)] + 2[g(5, 4) + g(6, 3)] + [g(6, 3) + g(7, 2)]$$

$$= g(4, 5) + 3g(5, 4) + 3g(6, 3) + g(7, 2)$$

$$= [g(3, 5) + g(4, 4)] + 3[g(4, 4) + g(5, 3)] + 3[g(5, 3) + g(6, 2)]$$

$$+ [g(6, 2) + g(7, 1)]$$

$$= g(3, 5) + 4g(4, 4) + 6g(5, 3) + 4g(6, 2) + 1$$

$$= [g(2, 5) + g(3, 4)] + 4[g(3, 4) + g(4, 3)] + 6[g(4, 3) + g(5, 2)]$$

$$\begin{aligned}
& +4[g(5, 2) + g(6, 1)] + 1 \\
& = g(2, 5) + 5g(3, 4) + 10g(4, 3) + 10g(5, 2) + 4 + 1 \\
& = [g(1, 5) + g(2, 4)] + 5[g(2, 4) + g(3, 3)] + 10[g(3, 3) + g(4, 2)] + 10[g(4, 2) + g(5, 1)] + 5 \\
& = 5 + 6g(2, 4) + 15g(3, 3) + 20g(4, 2) + 10 + 5 \\
& = 6[g(1, 4) + g(2, 3)] + 15[g(2, 3) + g(3, 2)] + 20[g(3, 2) + g(4, 1)] + 20 \\
& = 24 + 21g(2, 3) + 35g(3, 2) + 20 + 20 \\
& = 21[g(1, 3) + g(2, 2)] + 35[g(2, 2) + g(3, 1)] + 64 \\
& = 63 + 56(3) + 35 + 64 = 330
\end{aligned}$$

[Note: The official sol'ns employs the following table, which cuts down on the amount of working. $g(7, 5)$ can in fact be built up by starting with $g(2, 2)$:

$$g(3, 2) = g(2, 2) + g(3, 1) = 3 + 1 \text{ etc]}$$

n	$g(n, 1)$	$g(n, 2)$	$g(n, 3)$	$g(n, 4)$	$g(n, 5)$
1	1	2	3	4	5
2	1	3	6	10	15
3	1	4	10	20	35
4	1	5	15	35	70
5	1	6	21	56	126
6	1	7	28	84	210
7	1	8	36	120	330

Alternative (quicker) method (allowed by Official Sol'ns)

For $g(7, 5)$, suppose for example that the 1st child receives 2 balls, the 2nd child receives 1 ball, the 3rd child receives 0 balls, the 4th child receives 1 ball, and the 5th child receive 3 balls. This can be

denoted by $XX|X||X|XXX$ (where an $|$ indicates that we are moving on to the next child).

Then $g(7, 5)$ is the number of ways of choosing 4 positions for the $|$ s out of the available $7 + 4$ positions.

$$\text{So } g(7, 5) = \binom{11}{4} = \frac{11(10)(9)(8)}{4!} = \frac{11(10)(9)(8)}{24} = 11(5)(3)(2) = 330.$$

$$[\text{In general, } g(n, k) = \binom{n + (k - 1)}{k - 1}]$$

(v) First of all, a ball can be given to each of the k children (assuming $n \geq k$). The number of ways of handing out the balls then equals $g(n - k, k)$.

$$\begin{aligned} \text{Thus } h(7, 5) &= g(2, 5) = g(1, 5) + g(2, 4) \\ &= 5 + g(1, 4) + g(2, 3) \\ &= 5 + 4 + g(1, 3) + g(2, 2) \\ &= 9 + 3 + 3 = 15 \end{aligned}$$
