

Useful Results - Pure (6 pages; 28/12/19)

(1) Powers of Sines and Cosines

[To deduce $\sin^n\theta$ from $\cos^n\theta$:

(a) write $\sin^n\theta = \cos^n(90 - \theta)$ etc, or

(b) employ the following pattern:

(i) the coefficients are the same as for $\cos^n\theta$, apart from signs

(ii) the 1st term within the brackets is

$\sin\theta ; -\cos2\theta ; -\sin3\theta ; \cos4\theta ; \sin5\theta$ etc

memory aid: integrate to get to the next one (without applying the Chain rule!)

(iii) the signs of the terms within the brackets alternate]

$$\cos^3\theta = \frac{1}{4}(\cos3\theta + 3\cos\theta)$$

$$\sin^3\theta = \frac{1}{4}(-\sin3\theta + 3\sin\theta)$$

$$\cos^4\theta = \frac{1}{8}(\cos4\theta + 4\cos2\theta + 3)$$

$$\sin^4\theta = \frac{1}{8}(\cos4\theta - 4\cos2\theta + 3)$$

$$\cos^5\theta = \frac{1}{16}(\cos5\theta + 5\cos3\theta + 10\cos\theta)$$

$$\sin^5\theta = \frac{1}{16}(\sin5\theta - 5\sin3\theta + 10\sin\theta)$$

$$\cos^6\theta = \frac{1}{32}(\cos6\theta + 6\cos4\theta + 15\cos2\theta + 10)$$

$$\sin^6\theta = \frac{1}{32}(-\cos6\theta + 6\cos4\theta - 15\cos2\theta + 10)$$

$$\cos^7\theta = \frac{1}{64}(\cos7\theta + 7\cos5\theta + 21\cos3\theta + 35\cos\theta)$$

$$\sin^7\theta = \frac{1}{64}(-\sin7\theta + 7\sin5\theta - 21\sin3\theta + 35\sin\theta)$$

(2) $\cos(n\theta)$, $\sin(n\theta)$

[$\sin(2m\theta)$ can't be expressed in terms of powers of $\sin\theta$]

$$\cos 3\theta = 4\cos^3 \theta - 3\cos \theta$$

$$\sin 3\theta = -4\sin^3 \theta + 3\sin \theta$$

$$\cos 4\theta = 8\cos^4 \theta - 8\cos^2 \theta + 1$$

$$\cos 5\theta = 16\cos^5 \theta - 20\cos^3 \theta + 5\cos \theta$$

$$\sin 5\theta = 16\sin^5 \theta - 20\sin^3 \theta + 5\sin \theta$$

$$\cos 6\theta = 32\cos^6 \theta - 48\cos^4 \theta + 18\cos^2 \theta - 1$$

$$\cos 7\theta = 64\cos^7 \theta - 112\cos^5 \theta + 56\cos^3 \theta - 7\cos \theta$$

$$\sin 7\theta = -64\sin^7 \theta + 112\sin^5 \theta - 56\sin^3 \theta + 7\sin \theta$$

(3) (i) For odd and even n :

$$x^n - y^n = (x - y)(x^{n-1} + x^{n-2}y + \dots + xy^{n-2} + y^{n-1})$$

(ii) For odd n only:

$$x^n + y^n = (x + y)(x^{n-1} - x^{n-2}y + \dots - xy^{n-2} + y^{n-1})$$

(4) Tangents and normals to conics

(i) Parabola $y^2 = 4ax$ at $(at^2, 2at)$

$$\text{tangent: } y = \frac{1}{t}x + at$$

$$\text{normal: } y = -tx + 2at + at^3$$

(ii) Rectangular hyperbola $xy = c^2$

$$\text{tangent: } y = -\frac{1}{t^2}x + \frac{2c}{t}$$

$$\text{normal: } y = t^2x + \frac{c}{t} - ct^3$$

(5) Taylor expansions

(i) Maclaurin: $f(x) = f(0) + xf'(0) + \frac{x^2}{2!}f''(0) + \dots$

(ii) Taylor I: $f(x) = f(a) + (x - a)f'(a) + \frac{(x-a)^2}{2!}f''(a) + \dots$

(iii) Taylor II: $f(x + a) = f(a) + xf'(a) + \frac{x^2}{2!}f''(a) + \dots$

[$x = 0$ gives the Maclaurin expansion]

(6) Hyperbolic Functions

$$\cosh^2 x + \sinh^2 x = \cosh 2x; \quad \cosh^2 x - \sinh^2 x = 1$$

(7) Areas & Volumes

(i) Area of sector: $\frac{1}{2}r^2\theta$

(consider limit of area of triangle $\frac{1}{2}r^2 \sin \theta$ as $\theta \rightarrow 0$)

(ii) Volume of sphere: $\frac{4}{3}\pi r^3$

(iii) Volume of pyramid or cone: $\frac{1}{3} \times \text{base area} \times \text{height}$

(8) Derivatives

$$\frac{d}{dx}(a^x) = \ln a \cdot a^x$$

(9) Simpson's rule

$$\int_a^b y \, dx \approx$$

$$\frac{h}{3} \{ (y_0 + y_n) + 4(y_1 + y_3 + \dots + y_{n-1}) + 2(y_2 + y_4 + \dots + y_{n-2}) \}$$

$$\text{where } h = \frac{b-a}{n} \quad (n \text{ even})$$

(10)

$$\sqrt{2} = 1.4142135623730950488016887 \dots$$

$$e = 2.7182818284590452353602874 \dots$$

$$\text{Golden ratio: } \frac{1+\sqrt{5}}{2} = 1.618 \text{ (4sf)}$$

(11) Definitions

Whole numbers: integers

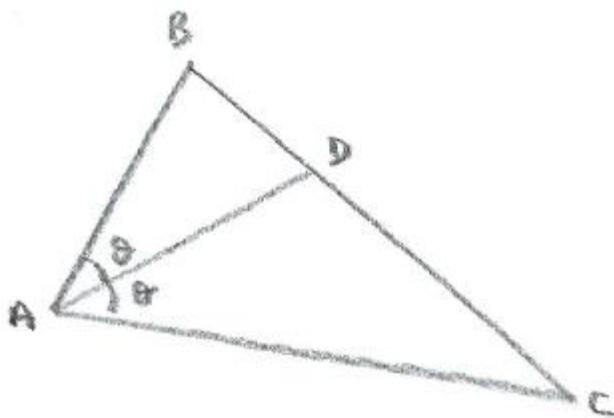

Natural numbers: no universal agreement;

usually $1, 2, 3, \dots$ (ie \mathbb{Z}^+) but sometimes $0, 1, 2, \dots$

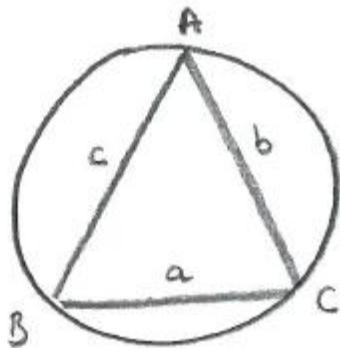

(12) Angle Bisector Theorem

Referring to the diagram below, the Angle Bisector theorem says that

$$\frac{BD}{DC} = \frac{AB}{AC}$$

(13) ABC is a triangle circumscribed by a circle of radius R, as shown in the diagram below.

As an extension of the Sine rule, $\frac{a}{\sin A} = 2R$

(14)

$$\begin{aligned} \text{(i)} \quad & (a + b + c)^3 = (a^3 + b^3 + c^3) \\ & + 3(a^2b + a^2c + b^2a + b^2c + c^2a + c^2b) \\ & + 6abc \end{aligned}$$

$$\begin{aligned} \text{(ii)} \quad & (a + b + c)^4 = (a^4 + b^4 + c^4) \\ & + 4(a^3b + a^3c + b^3a + b^3c + c^3a + c^3b) \\ & + 6(a^2b^2 + a^2c^2 + b^2c^2) + 12(a^2bc + b^2ac + c^2ab) \end{aligned}$$

$$\text{(iii)} \quad (a + b + c)^n = \sum_{\substack{i,j,k \\ (i+j+k=n)}} \binom{n}{i,j,k} a^i b^j c^k,$$

$$\text{where } \binom{n}{i,j,k} = \frac{n!}{i!j!k!}$$

(15) Reflection in the line $x = a$: $f(x) \rightarrow f(2a - x)$

(16) For the cubic $f(x) = ax^3 + bx^2 + cx + d$:

- (i) There is always one point of inflexion, at $x = -\frac{b}{3a}$
- (ii) Cubic curves have rotational symmetry (of order 2) about the PoI.
- (iii) The (x -coordinate of the) PoI lies midway between any turning points.
- (iv) The (x -coordinate of the) PoI is the average of the roots, when there are 3 real roots (and also when there are complex roots).
- (v) There will be two turning points when $b^2 > 3ac$

(17) Heron's formula for the area of a triangle with sides a, b & c :

$$\sqrt{s(s-a)(s-b)(s-c)}, \text{ where } s = \frac{1}{2}(a+b+c)$$
