2012 MAT - Q7 (3 pages; 15/10/22)

## Solution

(i)

1,2
and $1+2$ is a multiple of 3
Similarly for
2,1
(ii)

B can play 1 on his 1 st go. Then A can either play 0 or 2 . In both cases, $B$ can obtain a multiple of 3 :

| 0,1 | 0,2 |
| :--- | :--- |

| 0,1 | 2,0 |
| :--- | :--- |

(iii)

0,2
and $0+2$ is 1 less than a multiple of 3
Similarly for
2,0
(iv) After

1,2

A could just play 1, and B would be back to where he started (but having wasted a go), as the total after

## 1,2 1

is congruent mod 3 to the total after

## 1

(v)

| 1,0 | 1,0 |  |  |  | B wins, so A avoids 1 on 2nd go |
| :--- | :--- | :--- | :--- | :--- | :--- |

So A should play 2 on her $2^{\text {nd }}$ go.
[At first sight, the question is ambiguous here. Does it just mean: "What should Amy play on her $2^{\text {nd }}$ go?" (the simplest interpretation), or does it mean "What should Amy's strategy be for the rest of the game?" However, on reading (vi), we see that it isn't a foregone conclusion that A will win, and so (iv) must mean "What should Amy play on her $2^{\text {nd }}$ go?"]
(vi) From (iv), we see that the game should start off with

| 1,0 | 2 |
| :--- | :--- |

| 1,0 | 2,0 | 1,0 | 1,0 |  | B wins, so A avoids 1 on 4th go |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 1,0 | 2,0 | 1,0 | 2,0 | $1, \mathrm{X}$ | B can't win, so B avoids 0 on $4^{\text {th }}$ go |
| 1,0 | 2,0 | 1,0 | 2,1 | 0,1 | B wins, so A avoids 0 on 5th go |
| 1,0 | 2,0 | 1,0 | 2,1 | $2, \mathrm{X}$ | B can't win, so B avoids 1 on $4^{\text {th }}$ go, <br> and therefore B avoids 0 on $3^{\text {rd }}$ go |
| 1,0 | 2,0 | 1,2 | 0,2 |  | B wins, so A avoids 0 on 4th go |
| 1,0 | 2,0 | 1,2 | $1, \mathrm{X}$ |  | B can't win, so B avoids 2 on 3rd go, <br> and therefore B avoids 0 on 2nd go |
| 1,0 | 2,1 | 0,1 |  |  | B wins, so A avoids 0 on 3rd go |
| 1,0 | 2,1 | $2, \mathrm{X}$ |  |  | B can't win, so B avoids 1 on 2nd <br> go, and so B has no workable <br> option on 2 nd <br> will wo, and therefore A |
