Binomial Series and Coefficients

$$(1) (1 - x)^{-1} = \sum_{r=0}^{\infty} x^r \text{ (Geometric series)}$$

$$(2) (1 - x)^{-\frac{1}{2}} = \sum_{r=0}^{\infty} \frac{1}{2^{2r}} \binom{2r}{r} x^r \text{ (see STEP 2024/P2/Q6)}$$

$$(3) \sum_{r=0}^n \binom{n}{r} = 2^n \text{ [from } (1 + 1)^n]$$

$$(4) \sum_{r=0}^n r \binom{n}{r} = n2^{n-1}$$

$$\sum_{r=1}^{\infty} \frac{1}{r^p}$$

$$(1) \sum_{r=1}^{\infty} \frac{1}{r} = \infty \text{ ('harmonic' series)}$$

$$(2) \sum_{\text{prime } p} \left(\frac{1}{p}\right) = \infty$$

$$(3) \sum_{\text{perfect square } n} \left(\frac{1}{n}\right) = \sum_{r=1}^{\infty} \frac{1}{r^2} = \frac{\pi^2}{6} \text{ (Euler [1707-1783] - see Reference (A) for a proof)}$$

(4) Euler's constant, $\gamma = \lim_{n \rightarrow \infty} [(\sum_{r=1}^n \frac{1}{r}) - \ln(n)] = 0.57722$ (5sf)

This has been shown to be equal to $-\int_0^{\infty} e^{-x} \ln x \, dx$,

and also $\lim_{x \rightarrow 1^+} \sum_{r=1}^{\infty} (\frac{1}{r^x} - \frac{1}{x^r})$.

But it has never been proven to be irrational (though it is definitely expected to be transcendental – ie an irrational number that isn't the root of an algebraic equation with rational coefficients; other examples being π and e).

(5) $\sum_{r=1}^{\infty} \frac{1}{r} = \prod_{primes \, p} (\frac{1}{1-\frac{1}{p}})$ (where Π denotes a product)[Euler]

[(4) and (5) show that there is a connection between prime numbers, the harmonic series, and the natural logarithm; the Prime Number theorem (initially a conjecture by Gauss [30/4/1777-23/2/1855]) states that $\frac{\pi(x)}{x} \rightarrow \frac{1}{\ln x}$ as $x \rightarrow \infty$, where $\pi(x)$ is the number of primes less than or equal to x]

(6) $\sum_{r=1}^{\infty} \frac{1}{r^k} = \prod_{primes \, p} (\frac{1}{1-\frac{1}{p^k}})$ for $k \geq 1$ (Kronecker [1823-1891])

(7) As $\sum_{r=1}^{\infty} \frac{1}{r^2}$ is finite, $\sum_{r=1}^{\infty} \frac{1}{r^k}$ must be finite for $k \geq 2$ (as $\frac{1}{r^k} \leq \frac{1}{r^2}$ for each r).

In fact it has been shown that $\sum_{r=2}^{\infty} \frac{1}{r^k} \leq \frac{1}{k-1}$ (for $k \geq 2$)

(8) $\sum_{r=1}^{\infty} \frac{1}{r^3}$ is still undetermined (it is approximately 1.2021 and known as Apéry's constant), but others have been found (generally by Euler); for example: $\sum_{r=1}^{\infty} \frac{1}{r^4} = \frac{\pi^4}{90}$ and $\sum_{r=1}^{\infty} \frac{1}{r^6} = \frac{\pi^6}{945}$

Miscellaneous

$$(1) \sum_{r=0}^{\infty} \frac{1}{2r+1} (-1)^r = \frac{\pi}{4} \text{ and } \sum_{r=0}^{\infty} \frac{1}{(2r+1)^3} (-1)^r = \frac{\pi^3}{32}$$

$$(2) \sum_{r=1}^{\infty} \frac{r^2}{2^r} = 6 \text{ and } \sum_{r=1}^{\infty} \frac{r^3}{2^r} = 26$$

$$(3) \sum_{r=1}^{\infty} \frac{1}{r^r} \approx 1.2913 \left[\int_0^1 \frac{1}{x^x} dx \right]$$
